Abstract of JP 2001262016 (A)

PROBLEM TO BE SOLVED: To provide a dark color ink which has durability better than that obtained by using a conventional organic dye, is excellent in color tone, and is used for obtaining a film which can provide both privacy protection and sunlight-screening effects and to provide a coating liquid, a film, a substrate, a resin composition, and a molded resin article prepared by using the same.

SOLUTION: This dark color ink contains a dispersed dark color component comprising inorganic fine particles of titanium oxide nitride, titanium nitride, carbon black, or iron oxide and a dispersed sunlight-screening component comprising inorganic fine particles of ATO and/or ITO. The coating liquid is prepared by mixing the ink with a resin binder selected from among ultraviolet-curable resins, electron-beam-curable resins, thermosetting resins, and thermoplastic resins and is applied to films and substrates. The ink is mixed with an acrylic resin, a polyester resin, a butylal resin, or a polycarbonate resin to give the resin composition or the molded resin article.
